End of questions	11

I will talk about something on intelligence , some of my thoughts , you may like it , if not , no worries , just dont look at this file.

Lets accept the following ::

we have a biological existence which is a physical reality. We also have emotional experiences which are biologically generated mental construction about reality.

We have a brain. To a significant extent , it can be trained. But not controlled perfectly, but shaped, conditioned, stabilized and redicted over time. The brain is plastic. Through repetition, attention and behaviour, neural patterns strengthen or weaken. This is the basis of learning, meditation , therapy , habit formation, emotional regulation and skill acquisition. What you repeatedly attend to tends to become easier and more automatic.

with that basics , lets ask the following :

Lets say , you are seeing this line and interpreting it in your brain. What it means to say you are seeing something ? what happening when you see something ? how do you recognize these words and infere meaning ?

Lets say you know this language from chilhood and learned to interpret it. Okay. Here is the thing about it . What is that language ? collection of words right. What are those words ? symbols right ? how you infere from symbols ? you have representation for each symbol right. So this is the punch line. The world you consciuosly experience is a representation constructed by the brain. The moment you see a tree , you know it through your representation inference.

You never experience external reality "directly" in a raw form. What you experience is : sensory input, processes through neural systems in brain , organized into perceptions, interpreted using memory,prediction , language , and prior experience. For example :

Light hits the retina, the brain constructs color, depth,objects, motions, then "labels" them as "tree" , "person","danger", etc.. So your experienced world is a brain generated model of reality. **YOUR BRAIN SIMULATES YOUR REALITY.**

It is a predictive processing system. It constantly builds internal models,predicts incoming sensory data, updates the model when predictions fail. In this sense , conscious experience is representational.

But this does not mean external world is unreal. It means what we experience is mediated through neural representation.

Example: Color does not exist "out there" exactly as experienced. Electro-magnetic waves exist, the brain constructs the experience of "red". similarly sound,taste, images, sense of self, are all constructed experiences.

What happens when you stop labelling external world ?

When you stop labelling experience with words, perception can start to feel more direct and immediate, less filtered through narrative. Meditation sometimes

makes this more obvious because , labels weaken , perception becomes less conceptually filtered, you can observe experience forming moment to moment without filters.

Normally brain continuously does things like : "chair", "me" , "good", "bad" , "future" , "problem" , "memory".

This labelling is extremely useful for survival and planning. It compresses reality into concepts. But when labelling decreases, we will not construct narrative identity around labels. This often reduces the mental chatter because language is a major engine of self reinforcing cognition. This is the reason you are inferring all these in this moment by reading these lines.

There is a thing about brain. It operates through predictive models. It constantly categorize incoming information. Labelling is part of this compression system.

Is everything is human constructions ?

Everything human knows,describe, think, communicate about reality comes through human cognition constructions.

For example ::

language is constructed, concepts are constructed, Scientific theories are constructed, identities are constructed, social order and systems are constructed.

This doesn't mean that nothing exists independently of humans. A mountain likely existed before humans named it. Stars existed before astronomy.

What is constructed is ::

the model, the interpretations, the conceptual framework.

Why we construct ? Human never access reality completely unfiltered in its RAW form. We access : perceptions, interpretations, measurements, models through the structure of the nervous system and cognition.

so that's why :

"tree" , "electron", "nation" , "self" , "car" , "girl friend" , "hot" , "success" are all conceptual structures created by minds.

But some constructions corresponds to more closely to stable patterns in the external world than others. for example : physics models allow spacecraft to work, mathematical model predicts phenomena, medicine changes biology of the body predictably.

This success of modelling suggest that for physical reality there is a structure which we can capture using our labelled language which turns out to be mathematics.

In this way of thinking, all human knowledge is models, interpretations, representations, and conceptual constructions that humans use to describe and navigate experience.

Even science (widely used way of human conceptual constructions) works through hypothesis(claims) , measurements , models, probabilistic explanations.

So human knowledge is always mediated by perceptin , cognition ,language, measurement systems, and conceptual frameworks.

See clearly the power of human representative constructions which reduce the physical reality into an understandable form and make it easy for survival. All these constructions are referred as "ideas" or "thoughts". Civilization exist becuae somebody thought about it, somebody wrote a book about it, invention exist because we think in terms of the constructions and labels.

language

Rose said rain is falling down somehow. What is this word "falling" ? where it came from ? The word "falling" is a human concept and label. Nature itself does not conatin english categories like: "falling" , "up", "down" , "east" , "west" .

These are ways humans organize experience. What appears to exist independently is some underlying physical process or raltional change. Humans the model and describe that process using concepts like : "gravity", "acceleration", "spacetime curvature", "time evolution", "motion".

Caution: Im not touching the idea of time. It ruined so many peoples life than wars.

So in that sense "falling" is a conceptual category constructed by humans.

This way of concetualizing remains extremely useful tool for navigating life and communicating experience.

If everything is representation , then what is real reality ?

Nobody knows what it is ultimately. What humans have are : experiences, perceptions , models, mathematics, concepts, and conscious awareness of phenomens.

When we talk about real reality, we reached a point where language itself starts becoming limited because every answer becomes another conceptual construction.

So ultimately human experience representations, interpretations and appearances , not necessarily reality completely independent of cognition.

May be humans can partially decode some aspects of reality, but "decoding it fully" !!!!! ???? The brain itself is a part of the reality it is trying to decode and understand. It is like a tool trying to fully explain the sytem that produced the tool.

what you can prove ?

Lets say you saw a beautiful morning sun today. you walked for a while in the garden and saw a mountain nearby. Okay enough of chit chat , let me grind you.

Can you prove with absolute certainty that a "mounatin" exists independently of all the perception and conceptualization.

What happens is we can observe there are stable patterns in experiences, these patterns persist across observes and they resist our wishes and beliefs. We then label one such stable pattern as "mountain". The label is human made. But the underlying patterns appears not to depend on the label.

Notice one thing , the words im so far using and also using now to convey something are themselves conceptual tools.

So absolute proof becomes difficult because every proof uses cognition and concepts.

Reality deosn not arrive with labels attached. AT the deep lavel, there may be no completely final proof available, because any proof happening within consciousness, language and cognition.

World without humans funny

How world will be without humans ? Definatly less polluted .

On a serious note we do not really know, because every description we make is still a human description. Without humans , there would be no human language, no labels, no concepts like "mountain", "beauty", or "success", no human perception of whatsoever, no narrative about time and meaning. We can not fully imagine reality without human cognition becuae imagination itself is human cognition.

A dog experiences reality differently from a human. An ant experiences reality differently from dog. A bird sees and live the world around you in a completely different manner. Similarly the taste and feelings of each and every living being is different. So this human experience may be only a narrow mode of representation among many possible forms of experience. The world we experience is a human - interface version of reality.

Intelligence

Now Time for the question

::

are we intelligent ? what is that intelligence is ? another label ? another concept ? another tool ???????????? What human intelligence is trying is observe , construct , generalize which makes your survival easy. For us anything that makes our survival easy is "Intelligence". All Human derived knowledge converges to this point of survival which is by the way another human construction. Society exist because we want to survive , religion exist becuae we want

to survive as a tribe, science exist because we want to survive (nobody cares except few people that did you solved the quantum gravity(BTW those except few solving this for their survival , it so happened they choose this for it.) , but everybody wants a solution to cancer becuae of survival motive behind it.)

Should we laugh at or wonder when people say "artificial intelligfence is going to get AGI" ? You see the evolution of computers. They are electronic devices at first. We have to supply the power for them to work. Without electricity they are like another garbage tool. Okay lets say we pass electricity. They are circuits of transistors. Transistors can either be turned on or off . Using this control we create gates , by assembling gates , we create Integrated circuits , with these we create CPUs. At the core level , computer processes electricity according to some condition which says to flow or not.

To make it useful with the conditions obeyed by ICs , we created something called "Computer programmes". What it means when you say I provide "if" condition in the code, it means you are asking CPU to activate particular gates for the flow of elctricity. So "if" condition is a representation label invented by humans which is used to convey some message to Computer CPU. That's why we call them as "computer languages". Thats why they are highly logical and they have to be. We create data environment with our labels (like list , character , set , tuple)and impliment that using symbols invented for computers and now we have to human-machine interface. Again we use this for making our life more automatic as these machines dont think on their. They follow rules. "Machine dont think on their own !!!!". Now we want to make them think (simulate their environment on their own). You see what happening here , we want some machine to mimic our behaviours and patterns.

"Pattern" is computable. how ? mathematics.

Mathematics through its abstraction search for patterns and structures and generalizes it. With it everything becomes special case.

Now the question is how can we make machines to "behave" as us ?

answer is by making them to learn the patterns and structures of our life.

Majorly what we do , observe and sample actions from brain for a given environment or conditions. We are a conditional action samplers. That is our pattern.

So we want machines to sample something given a situation. Where smpling comes ? from distribution of corresponding situation. Here we go we want machine to learn the distribution of the situations of us.

How we make it ? we dont know the distribution, but we can collect samples and estimate from samples the underlying ditribution.

That is precisely what AI is doing. ALL models are samplers of some distribution.

Here we go human intelligence is "sampling actions which enhances the survivality"

AI is "sampling data from a learned distribution of data which enhances the human use of it for his better (in turn his survival)"

(see here majorly , we are taking about "our generalized behaviour", we are actually much more complex that our behaviour, we are more abstract to put

in data. Only we can put our labelled language as data , our actions as data , our reinforcement as data , because we get data through us for all these . But what about consciousness , where is the data for it ? what about biochemistry responsible for brain itself , where is the complete compact coherent data for it ? what about relationships and feelings we get and experience on our own (self cognition generated) like for example what data accounts for holding your child's and walking in a beach , what data accounts for your mom's compassion for you , what data accounts for your dog jumping towards you , where is the data for it ? what about spaces which we ourselves don't know ? where is the data ? without data and electricity machines are just plastic and iron and glass. Don't get persuaded by words like "Artificial intelligence" , "AGI". This "era of AI" is another advance in the way we work for our survival. There is nothing more to it or less to it. Because it is ultimately about us , about our game of survival.

What should you do by knowing all these human ways ?

Let's approach this question in a healthy way. Don't use these inferences to detach from every day life by saying like "There is no meaning to life" , "I'm not I , I is representation" . Observe this knowledge without identification. Even if you are "ENLIGHTENED HUMAN BEING", you are still biological human , you have to eat, work , learn , build relationship , create things, care for the body and make decisions.

Know that language is labels , labels are representation and so on . That's fine , but use them as tools , identities as flexible constructions to carry out the everyday business.

Don't think like "nothing is real, so nothing matters". This kind of thoughts are intellectually seductive but psychologically ungrounded. SEE even if concepts are constructed : Pain still hurts, relationship still affects people, actions still have consequences, the body still requires care. YES , concepts are not ultimate truth, but they are useful functional tools.

Use labels , representations , language pragmatically. Don't be trapped inside them. Remain grounded in direct experience and cultivate awareness without abandoning ordinary responsibilities.

wash dishes , clean your room , go for a walk , do your work , be attentive, reduce unnecessary suffering, treat others well and also remain aware of how mind constructs experiences.

These functional tools like labels , languages, concepts help you to coordinate, communicate, remember , plan, maintain continuity and operate within society.

These functional tools are for worldly transactions and navigation.

for example :

The "self" helps maintain continuity of memory and decision making, "ownership" helps organize resources , names help social coordination.

But be careful that when these tools become sources of suffering when treated as absolute and permanent realities.

The brain start building rigid identifications ::

"This is me" , "This must not change" , "This possession defines me" , "My status is my worth".

Then fear , attachment, comparison and anxiety appears and intensify.

That does not mean , abandon identity, reject society like a monk, or stop functioning. (I was in this path some time ago !!! haaaahahahahahahahaha-hahah)

It means use the constructs pragmatically, without becoming completely psychologically imprisoned by them. For example , use your name , but you may stop feeling that the conceptual identity fully defines what you are. Own some possessions like shoes (i like new balance and nike), bike (i like all KTM bikes , triumph street triple RS , BMW s1000 RR, ninja H2R , decati panegale V4s , ninja zx 6r), car (i like lamborghini aventador (i know it is discontinued) after that i loveeeeeeee toyota hilux, what a truck man , i also like tata sierra, nexon , creta(i once over took creta in a highway in my bike at 150 + kmph , that guy started that race, i didnt gave up, it gave me high adrenaline)), whatever you like books guitar , morning walk , cooking , movie all those things. At the same time understand that they are temporary arrangements within changing conditions. This way , dont withdraw from life , but have lighter attachment, greater flexibility, reduce egoic conflict, and be more grounded in ordinary living.

what Im saying is "There is a middle path to life", not clinging , not rejecting but using things and experiences consciously. A more practical way to approach this is to repeatedly observe the difference between direct experience and the mental story built around it.

for example , you can use the idea "my career" as a functional tool for action and planning. But unnecessary suffering increases when the mind turns it into a story as "This is my entire worth and identity". So the practice is not destroying concepts , but loosening identification with them.

Some consideration in this may be as follows :

1. Notice the impermanence of everything. Everything changes , body , emotions, relationship , status, possessions , thoughts. SEE THIS CLEARLY. This reduces the rigid attachment naturally.

2. Use concepts functionally. you still say "my phone" , "my work" , "my research" , because language is practical. But inwardly you recognize these are temporary relational arrangements, not the permanent self definition.

3. Observe craving and resistance

Attachments often appears as fear of losing, compulsive grasping, identity defence, comparison, psychological dependence. Detaching in unhealthy sense can appear as suppression of emotions , emotional withdrawal, indifference , avoidance.

When you observe all these , when you cultivate an awareness of observing , it allows you to engage without being consumed.

4. Stay close to direct experience. This I figured out by doing mind training of which mediation is one of the exercise. Mediation is a great tool for direct experience. I use sam harris "WAKING UP" app with around 2200 rupees subscription yearly. I love that guy , he made it so simple. I recommend this for everyone. With meditation , you observe thoughts arising and dropping in consciouness(not very early), here concepts still be there but now more lighter and flexible.

5. Participate fully in life; this is important , dont escape the world, engage without becoming psychologically trapped. love people, work deeply, create things, care for the body, pursue worldly meaning , while also understand that all experiences are transient and changing.

THATS HELL LOT OF A LIFE MOTIVATION , YOU DO WHATEVER YOU WANT WITH YOUR TIME ON EARTH , NOTHING IS BAD OR GOOD ON ITS OWN. ITS IMPORTANT THAT YOU DO IT.

The Game of Survival

On earth we live for some years , we construct concepts , ideas , identifications, learn language , get a job , get married .. and so on .

Why we do all these ???

Beacuse we are playing a game of survival at the time at all the places we are in. So all our problems and suffering arises from the survival games we play and "self rules" we adapt to feel comfortable survivality. All the time we are solving a problem of survivality. Society rewards those who solves problems. For the problem of food and shelter : we found agriculture and homes.

For the problem of communication : we found symbols and languages.

For the problem of health : we found medicines.

For the problem of loneliness : We found tribe living or modern civilized society.

For society to sustain : we found rules such as morals, religion , concept of family.

For the problem of confusion on existence and search for meaning of life : We found religion, spirituality , philosophy and ultimate answer as "GOD".

For the problems of Physical world : We found science , engineering.

For the problem of understanding the structure and pattern in nature through quantitive labels : We found mathematics and statistics.

For the problem of social transactions : we found exchange value system (which we call money) and all the rules of economics.

For the problem of social order : We found politics (Humans are now inherently political with beliefs and biases because their birth in this time and environment is like that).

For the problem of relationships and feelings : we found psychology.

For the problem of expression : We found fine arts such as painting, literature , photography , traveling, music, all kind of sports and so on.

For the problem of large scale computation which we cant handle : we found computers. (Now they are solving the problem of automation(This is all about software development : Figure out a problem , solve it using computers and automate it for social use))

For large scale connection and communication : we found facebook , instagram , whatsapp , slack.. (When i was in 9th class, i got into FB and by 11th class i deleted it because i was into it a lot , then i didnt used any social media a lot (recently i installed instagram for 3 months and then i deleted it (i posted 20 post in 3 months and watched more than 1000 reels and sent to my friends and they were like why you installed IG.)) Nowadays these platforms are easy money making advertising platforms with good reach and social validation and attention loops(i heard an average girl get 10 proposal at least, how can we expect her to love one person with 10 proposal ??? !!!!!!!).

For the problem of boredom : we found drugs , alcohol , smoking , vacation , ride and all those social consumptions.

For different domainal problems we have domain specific ways to handle them.

SEE THAT ALL WE ARE DOING IS SOLVING OUR SURVIVAL PROBLEMS WITH SOME CONSTRUCTIONS

Its all about this survival game , we are solving a survival problem all the time because we want to live comfortable survival because at the end death ceases everything.

All the things human inven, discover and materialise is a solution to a problem of survivality.

Based on the domain they are in , they are called as business man , lawyer , doctor , driver , spiritual guru , therapist , coach , scholar, author , musician and so on labels based on the solutions they provide.

You may ask me "what about a person who dont have any survival problems like money , health , family , boredom and so on ?" Atleast to my mind three possible answers comes right now , one is that , that person is dead, two. He or she may be in coma , three. this is most accurate that , that kind of person dont exist at all(come on we know this !!!).

Survival problems are not at all bad on their own. These problems carry out our life. In fact we should have those in our life to have temporary sense and meaning of life around us like what we do , why are we doing it . THEY shape these questions. To me , if a person dont have survival problems , his/her life is dry and dull to me. Everything that is living plays the game of survival.

You can ask me "if death is where you exit the survival game, why can't you die and exit the loop , instead of suffering ?" Actually that's precisely what we do. We die for thousands yesterdays on every single day both psychologically

and physically. We know yesterday is gone. We don't live for it. We continue today's survival. We may have yesterday's memory, but that memory is happening now, in this moment. Just because we have memory, we can't get back to yesterday. It's gone. (That's why they say "Past is past"). All we have is this moment and all we do is to survive this moment comfortably. As today unfolds to tomorrow, what we call today is gone and tomorrow unfolds and again that survival game continues. Our present moment happiness and suffering is a psychological game. Our suffering in this moment for yesterday's memory is a psychological game of survival, you want that which brings suffering and "YOU WANT IT", that's why you suffer, similarly happiness, you want it and you create it. Yesterday has its own yesterday to worry, tomorrow has its own tomorrow to hope. But you have neither yesterday nor tomorrow in your hand; all you have is now, this moment, aware and make the most out of it in your own way.

Beyond Survival Game

What exists for us beyond game of survival? Let's say we fix our income source, a family, a shelter. We took care of our worldly needs in a good way. What else we do? Now you slowly start to observe!!!!. Beyond the game of survival there is a deep silence inside you, all the time you were escaping from it because in that silence there are no labels, representations, no burden of existence and experiences. It is not void space. That state beyond labels, language, representations, and worldly appearances. It is rich in (I don't know what word to put) Love and harmony. It is the state of creations or genesis. If you observe this, you still outwardly remain functional with your responsibilities. But you remain untouched by worldly happenings. Can you imagine how it feels to remain in silence? (in that state) internally for 2 to 3 seconds? (I experience this for sometime, after 2 to 3 seconds my mind starts to wander in thoughts)... what about a minute? what about an hour? what about a day? a year or what if that state is what you are being? Honestly I don't know that state of remaining completely silent forever internally irrespective of cognitive inputs and noises happening around you. I don't know that. But I know for 2 to 3 seconds interval how it feels. That is where game of survival ends even when you are alive. It's like you see a flower, but you don't name it or feel its perfume. You come to a connection with it. Similarly with all the nature around you. Your mind is completely integrated with the current moment you are living without thoughts or anything for that matter. You remain untouched but at the same time you are in contact with everything. Maybe This is what LOVE is.

End of questions

I had a lot of questions, like what is life? what is existence? why all this exist? why life exist at all? why does consciousness exist? what is ultimate

reality ? why there is existence at all ?? By now you must see the problems in asking these questions. The ideas themselves like life, existence, reality are all constructed representations, you have a prior ground on which you are thinking about that ground, you are in a loop. Its like you are in a pool and trying to find that pool you are in.

I understood the limitations and loops of human cognition.

AFTER A WHILE , NOW, I DONT HAVE ANY QUESTIONS

A short note on morals and suffering(I dont want to go deep) :

I still remember, when i was child, i always wanted to be perceived as good boy by others than to myself. Over the time I done lot of wrong things and i still do , i still suffer , im still human , i have no problem with these things now. I used to escape suffering , now i dont. Im okay with that. In fact im okay with anything now. **Becuase I know the game now(game of smooth comfortable survival) , i understand the loop I'm in.** I see clearly the necessity of morals created by humans in a society. There are a set of labels they call as good with Representative words like : Love, honesty, loyal , kind hearted , Disciplined , hard work , peaceful , knowledgable and so on (you think whatever you are here) and bad like arrogant , saddist , narccist, criminal , murderer, hate , desperate and so on ... The main necessity of morals is the survival. Moral labels smoothens the animal behaviour in you (at the end we are animals) and make a balance livelihood between powerful and powerless in society otherwise society wont survive in itself.

Having morals is not bad , it is in fact very good for a healthy living on your own terms leave the society. But intrincally conditioned by them without even knowing that your are biased and conditioned is what leads you to suffer.

Suffering :

It is just another human narrated label for you to be in society's business. What is it fundamentally ? A temporary state of uncomfortable mind. Where this uncomfortable mind is coming from ? It is through aligned representation of this time you are in as being not getting what you want or desired at your core , in this temporary state. Then you start to label that as "Im unhappy in life" , "Im sad" , "Im unlucky" , "Nobody loves me" , "I should not have been born" and so on (AT times I said all these to myself , when I did not understood the game, haha). Then what you will do ? you search for escapes which aligns you or smoothens your uncomfortable mind to a level of comfort , this is also temporary.

Like books , spiritual path , meditation or drugs or alcohol , GYM , Music , cooking , new GF/BF , go for a ride , go for a date and so on endless transient smoothening escapes.

The only permanent solution is : Do all those things by your heart or to escape the present discomfort , but also know that you are actually escaping and your mind is uncomfortable. This clarity is enough. Becuase awareness alone dissolves the illusion of suffering. By all means suffer(I do , i dont escape)

and get through escapes(I try escapes all kind which ever make sense to "my morality") and also know that you are escaping.

After knowing the game :::::

In the remaining years on earth I will just walk on earth , cook and eat , wash dishes , take care of the body , sleep well, open eyes and take a long rides and experience breeze , rain and hot summer. Suffer when my time comes for it. Feel more compassionate for others , because for me being kind is the greatest thing one can do to others because they are just like us with different life situations. If possible and get a chance to have a positive impact on people life and nature around me , i will do that. I will open my eyes towards mother earth , she has lot to show me and make me wonder. (Every time I visit same hill station or beach or for that matter any random road ; it feels fresh and new experience. I dont feel like I visited this already.) Over time , I will sleep permanently with a final goodbye.

Acknowledgement : I thank my thousand yesterdays and experiences.

Reference : My mind and my thousand yesterday's experiences, Suffering, happy moments ,Confusions , wanderring and wonderings...
